# Communication avoiding algorithms for LU and QR factorizations 

Laura Grigori
Alpines
INRIA Paris - LJLL, Sorbonne Université

October 2021

## Plan

- Motivation
- Communication complexity of linear algebra operations
- Communication avoiding for dense linear algebra
- LU, QR, Rank Revealing QR factorizations
- Progressively implemented in ScaLAPACK, LAPACK
- Algorithms for multicore processors
- Conclusions

## Motivation - the communication wall

- Runtime of an algorithm is the sum of:
- \#flops x time_per_flop
- \#words_moved / bandwidth
- \#messages x latency
- Time to move data >> time per flop
- Gap steadily and exponentially growing over time

## Motivation - the communication wall

- Runtime of an algorithm is the sum of:
- \#flops x time_per_flop
- \#words_moved / bandwidth
- \#messages x latency
- Time to move data >> time per flop
- Gap steadily and exponentially growing over time

| Annual improvements |  |  |  |
| :---: | :---: | :---: | :---: |
| Time/flop |  | Bandwidth | Latency |
| $59 \%$ | Network | $26 \%$ | $15 \%$ |
|  | DRAM | $23 \%$ | $5 \%$ |

Adapted from J. Demmel

- Performance of an application is less than $10 \%$ of the peak performance
"We are going to hit the memory wall, unless something basic changes"
[W. Wulf, S. McKee, 95]

## Compelling numbers

DRAM latency:

- DDR2 (2007) ~ 120 ns 1 x
- DDR4 (2014) ~ 45 ns
2.6x in 7 yrs
- Stacked memory ~ similar to DDR4

Time/flop

- 2008 Intel Nehalem $3.2 \mathrm{GHz} \times 4$ cores ( 51.2 GFlops/socket) 1 x
- 2017 Intel Skylake XP $2.1 \mathrm{GHz} \times 28$ cores (1.8 TFlops/socket) 35 x in 9 yrs

Network latency

- Interconnect (example one machine today): $0.25 \mu$ s to $3.7 \mu \mathrm{~s} \mathrm{MPI}$ latency

## Selected past work on reducing communication

- Only few examples shown, many references available

## A. Tuning

- Overlap communication and computation, at most a factor of 2 speedup
B. Ghosting
- Standard approach in explicit methods
- Store redundantly data from neighboring processors for future computations

Example of a parabolic PDE

$$
u_{t}=\alpha \Delta u
$$

with a finite difference, the solution at a grid point is:

$$
\begin{aligned}
u_{i, j+1} & =u\left(x_{i,}, t_{j+1}\right) \\
& =f\left(u_{i-1, j}, u_{i j}, u_{i+1, j}\right)
\end{aligned}
$$

Page 6

## Selected past work on reducing communication

C. Same operation, different schedule of the computation

Block algorithms for dense linear algebra

- Barron and Swinnerton-Dyer, 1960
- LU factorization used to solve a system with 31 equations - first subroutine written for EDSAC 2
- Block LU factorization used to solve a system with 100 equations using an auxiliary magnetic-tape
- The basis of the algorithm used in LAPACK

Cache oblivious algorithms

- recursive Cholesky, LU, QR (Gustavson ‘97, Toledo ‘97, Elmroth and Gustavson '98, Frens and Wise '03, Ahmed and Pingali '00)

## Selected past work on reducing communication

D. Same algebraic framework, different numerical algorithm

More opportunities for reducing communication, may affect stability

Dense LU-like factorization (Barron and Swinnerton-Dyer, 60)

- LU-like factorization based on pairwise pivoting and its block version $P A=L_{1} L_{2} \ldots L_{n} U$
- With small modifications, minimizes communication between two levels of fast-slow memory
- Stable for small matrices, unstable for nowadays matrices

## Communication in CMB data analysis

- Map-making problem
- Find the best map $x$ from observations $d$, scanning strategy $A$, and noise $N^{-1}$
- Solve generalized least squares problem involving sparse matrices of size $10^{12}$-by- $10^{7}$
- Spherical harmonic transform (SHT)
- Synthesize a sky image from its harmonic representation
- Computation over rows of a 2D object (summation of spherical harmonics)
- Communication to transpose the 2D object
- Computation over columns of the 2D object (FFTs)

SHT, with R. Stómpor, M. Szydlarski Simulation on a petascale computer

## Motivation

- The communication problem needs to be taken into account higher in the computing stack
- A paradigm shift in the way the numerical algorithms are devised is required
- Communication avoiding algorithms - a novel perspective for numerical linear algebra
- Minimize volume of communication
- Minimize number of messages
- Minimize over multiple levels of memory/parallelism
- Allow redundant computations (preferably as a low order term)

## Evolution of numerical libraries

## LINPACK (70's)

- vector operations, use BLAS1
- HPL benchmark based on Linpack LU factorization

## ScaLAPACK (90's)

- Targets distributed memories
- 2D block cyclic distribution of data
- PBLAS based on message passing

## LAPACK (80's)

- Block versions of the algorithms used in LINPACK
- Uses BLAS3

## PLASMA (2008): new algorithms

- Targets many-core
- Block data layout
- Low granularity, high asynchronicity

Project developed by U Tennessee Knoxville, UC Berkeley, other collaborators.
Source: inspired from J. Dongarra, UTK, J. Langou, CU Denver

## Communication Complexity of Dense Linear Algebra

- Matrix multiply, using $2 \mathrm{n}^{3}$ flops (sequential or parallel)
- Hong-Kung (1981), Irony/Tishkin/Toledo (2004)
- Lower bound on Bandwidth $=\Omega$ (\#flops / M ${ }^{1 / 2}$ )
- Lower bound on Latency $=\Omega\left(\# f l o p s / M^{3 / 2}\right)$
- Same lower bounds apply to LU using reduction
- Demmel, LG, Hoemmen, Langou 2008

$$
\left(\begin{array}{ccc}
1 & & -B \\
A & 1 & \\
& & 1
\end{array}\right)=\left(\begin{array}{lll}
1 & & \\
A & 1 & \\
& & 1
\end{array}\right) \cdot\left(\begin{array}{ll}
1 & \\
& -B \\
& 1
\end{array}\right)
$$

- And to almost all direct linear algebra [Ballard, Demmel, Holtz, Schwartz, 09]

## Lower bounds for linear algebra

- Computation modelled as an n-by-n-by-n set of lattice points (i,j,k) represents the operation $\left.c(i, j)+=f_{i j}\left(g_{i j k}\left(a(i, k)^{*} b(k, j)\right)\right)\right)$
- The computation is divided in $S$ phases
- Each phase contains exactly M (the fast memory size) load and store instructions
- Determine how many flops the algorithm can compute in each phase, by applying discrete Loomis-Whitney inequality:

$$
w^{2} \leq N_{A} N_{B} N_{C}
$$

Algorithms in direct linear alg

$$
\text { for, } j, k=1: n
$$

$$
c(i, j)=f_{i j}\left(g_{j j k}(a(i, k), b(k, j))\right)
$$

endfor- set of points in $R^{3}$, represent $w$ arithmetic- orthogonal projections of the points onto coordinate planes $N_{A}, N_{B}, N_{G}$ represent values of A, B, C

## Lower bounds for matrix multiplication (contd)

- Discrete Loomis-Whitney inequality:

$$
W^{2} \leq N_{A} N_{B} N_{C}
$$

- Since there are at most 2 M elements of $\mathrm{A}, \mathrm{B}, \mathrm{C}$ in a phase, the bound is:

$$
w \leq 2 \sqrt{2} M^{3 / 2}
$$

- The number of phases $S$ is \#flops/w, and hence the lower bound on communication is:
$\#$ messag $(S) \geq \frac{\# \text { flops }}{w}=\Omega\left(\frac{\# \text { flops }}{M^{3 / 2}}\right)$
\#loadslstores $\Omega\left(\frac{\# \text { flops }}{M^{1 / 2}}\right)$

## Matrix distributions

1) 1D Column Blocked Layout

2) 1D Column Block Cyclic Layout
3) 2D Row and Column Blocked Layout

णपणाणणन

| 2 | 3 | 2 | 3 | 2 | 3 | 2 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| 2 | 3 | 2 | 3 | 2 | 3 | 2 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |

| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 3 | 2 | 3 | 2 | 3 | 2 | 3 |

| 2 | 3 | 2 | 3 | 2 | 3 | 2 | 3 |

| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| 2 | 3 | 2 | 3 | 2 | 3 | 2 | 3 |

## Generalizes others

6) 2D Row and Column Block Cyclic Layout

## MatMul with 2D Layout

- Consider processors in 2D grid (physical or logical)
- Processors can communicate with 4 nearest neighbors
- Broadcast along rows and columns

- Assume $p$ processors form square $s \times s$ grid, $s=p^{1 / 2}$

## Cannon' s Algorithm

$\ldots \mathrm{C}(\mathrm{i}, \mathrm{j})=\mathrm{C}(\mathrm{i}, \mathrm{j})+\sum_{k} \mathrm{~A}(\mathrm{i}, \mathrm{k})^{*} \mathrm{~B}(\mathrm{k}, \mathrm{j})$
... assume $s=\operatorname{sqrt}(p)$ is an integer
forall $\mathbf{i = 0}$ to s-1 ... "skew" $A$
left-circular-shift row i of A by i
... so that $A(i, j)$ overwritten by $A(i,(j+i) m o d s)$
forall $\mathrm{i}=0$ to $\mathbf{s - 1} \quad . .{ }^{-1}$ "skew" $B$
up-circular-shift column i of By i
... so that $B(i, j)$ overwritten by $B((i+j) \bmod s), j)$
for $k=0$ to $\mathbf{s - 1} \quad . .$. sequential
forall $\mathrm{i}=0$ to $\mathbf{s - 1}$ and $\mathbf{j = 0}$ to $\mathbf{s - 1} \quad . .$. all processors in parallel
$C(i, j)=C(i, j)+A(i, j) * B(i, j)$
left-circular-shift each row of $A$ by 1
up-circular-shift each column of $B$ by 1

## Cannon's Matrix Multiplication

Cannon's Matrix Multiplication Algorithm

| $\mathbf{A ( 0 , 0 )}$ | $\mathbf{A ( 0 , 1 )}$ | $\mathbf{A ( 0 , 2 )}$ |
| :--- | :--- | :--- |
| $\mathbf{A ( 1 , 0 )}$ | $\mathbf{A ( 1 , 1 )})$ | $\mathbf{A ( 1 , 2 )}$ |
| $\mathbf{A ( 2 , 0 )}$ | $\mathbf{A ( 2 , 1 )}$ | $\mathbf{A ( 2 , 2 )}$ |

| $B(0,0)$ | $B(0,1)$ | $B(0,2)$ |
| :--- | :--- | :--- |
| $B(1,0)$ | $B(1,1)$ | $B(1,2)$ |
| $B(2,0)$ | $B(2,1)$ | $B(2,2)$ |

Initial A, B

|  |  |  |
| :--- | :--- | :--- |
| $A(0,0)$ | $A(0,1)$ | $A(0,2)$ |
| $A(1,1)$ | $A(1,2)$ | $A(1,0)$ |
| $A(2,2)$ | $A(2,0)$ | $A(2,1)$ |

| $\mathrm{B}(0,0)$ | $\mathrm{B}(1,1)$ | $\mathrm{B}(2,2)$ |
| :--- | :--- | :--- |
| $\mathrm{B}(1,0)$ | $\mathrm{B}(2,1)$ | $\mathrm{B}(0,2)$ |
| $\mathrm{B}(2,0)$ | $\mathrm{B}(0,1)$ | $\mathrm{B}(1,2)$ |

A, B after skewing

|  |  |  |
| :--- | :--- | :--- |
| $A(0,1)$ | $A(0,2)$ | $A(0,0)$ |
| $A(1,2)$ | $A(1,0)$ | $A(1,1)$ |
| $A(2,0)$ | $A(2,1)$ | $A(2,2)$ |

| $B(1,0)$ | $B(2,1)$ | $B(0,2)$ |
| :--- | :--- | :--- |
| $B(2,0)$ | $B(0,1)$ | $B(1,2)$ |
| $B(0,0)$ | $B(1,1)$ | $B(2,2)$ |

A, B after shift $k=1$

| $A(0,2)$ | $A(0,0)$ | $A(0,1)$ |
| :--- | :--- | :--- |
| $A(1,0)$ | $A(1,1)$ | $A(1,2)$ |
| $A(2,1)$ | $A(2,2)$ | $A(2,0)$ |

| $B(2,0)$ | $B(0,1)$ | $\mathbb{B}(1,2)$ |
| :--- | :--- | :--- |
| $B(0,0)$ | $B(1,1)$ | $B(2,2)$ |
| $B(1,0)$ | $B(2,1)$ | $B(0,2)$ |

A, B after shift k=2

$$
\mathrm{C}(1,2)=\mathrm{A}(1,0) \text { * } \mathrm{B}(0,2)+\mathrm{A}(1,1) * \mathrm{~B}(1,2)+\mathrm{A}(1,2) \text { * } \mathrm{B}(2,2)
$$

## Cost of Cannon' s Algorithm

$\begin{array}{ll}\text { forall } \mathbf{i}=0 \text { to } \mathbf{s - 1} & \ldots \text { recall } s=\operatorname{sqrt}(p) \\ \quad \text { left-circular-shift row i of } \mathbf{A} \text { by } \mathbf{i} \quad \ldots \operatorname{cost} \leq s^{*}\left(\alpha+\beta^{*} n^{2 / p}\right)\end{array}$ forall $\mathrm{i}=0$ to $\mathrm{s}-1$
up-circular-shift column i of B by i ... cost $\leq s^{*}\left(\alpha+\beta^{*} n^{2 / p}\right)$
for $k=0$ to $s-1$
forall $\mathrm{i}=0$ to $\mathrm{s}-1$ and $\mathrm{j}=0$ to $\mathrm{s}-1$

$$
C(i, j)=C(i, j)+A(i, j)^{*} B(i, j) \quad \ldots \text { cost }=2^{*}(n / s)^{3}=2^{*} n^{3 /} p^{3 / 2}
$$ left-circular-shift each row of $\mathbf{A}$ by $1 \ldots$ cost $=\alpha+\beta^{*} n^{2 / p}$ up-circular-shift each column of B by $1 \quad . . . \operatorname{cost}=\alpha+\beta^{*} n^{2 / p}$

- Total Time $=2^{*} n^{3} / p+4^{*} s^{*} \alpha+4^{*} \beta^{*} n^{2 / s}$ - Optimal!
- Parallel Efficiency $=2^{*} n^{3} /(p$ * Total Time)

$$
\begin{aligned}
& =1 /\left(1+\alpha^{*} 2^{*}(s / n)^{3}+\beta^{*} 2^{*}(s / n)\right) \\
& =1 /(1+O(\operatorname{sqrt}(p) / n))
\end{aligned}
$$

- Grows to 1 as n/s = n/sqrt(p) = sqrt(data per processor) grows
